AutoCAD. LISP The AutoCAD LISP (AutoCAD Library for LISP) is a library written in LISP for writing macros and functions to the AutoCAD command set. LISP, especially the latest version of CLisp, offers a user-friendly way to write macros and functions in AutoCAD without needing to know how the syntax works, or even knowing how to program. Before version 11, the LISP was mainly used in AutoCAD for writing macros and functions that enhance the user interface (UI) of the program. However, for many years now it has also been used in a different way: as a means of writing new commands and functions. An example would be adding your own commands or functions, or other functionality like opening/closing/sorting objects, changing an object's attributes (colour, linetype, lineweight, etc.) or transforming an object. In the course of extending AutoCAD's functionality, designers and engineers have come up with many ideas, and the LISP language has been developed to express many of these ideas. The LISP can be used in a variety of ways, including, but not limited to, the following: Macro, programming definition of functions. Program, definition of procedures, dialog boxes, help files, menus, etc. Extension, add-on products that add functions and commands to AutoCAD. The library has a large number of commands and functions to make it easy to create and execute macros and functions. They are based on the following: Static, for preparing user interface elements (dialogs boxes, menus, etc.) Dynamic, for defining new commands and functions. The LISP is generally based on the same syntax as AutoCAD commands. A user may enter one or more commands on a command line, as with the command line in AutoCAD. A user may also write a string of code in the LISP language directly, without using any AutoCAD commands or functions. Toolsets A toolset is a collection of a1d647c40b
